It may also be distributed to groups for educational purposes (classes, lectures, educational seminars. etc). However, all contents including but not limited to Conservation Display Ratings may not be posted to web sites and may not be reproduced or distributed for corporate research, marketing, or other promotional purposes without written permission from Aardenburg Imaging & Archives.

About this Report

This report contains light fastness information about a single test print produced by a specific digital printing system. "System" refers to all hardware, software, and materials used to make the finished print. The hardware, software, material components, and printmaker's skills contribute to the final image quality and image permanence. The tested sample is made with current or recently discontinued stocks of commercially available products unless otherwise stated. Each sample has been prepared by Aardenburg Imaging & Archives or one of its members in accordance with customary print making practices unless otherwise noted. The sample may also contain additional finishing materials such as overcoats and laminates which are also noted when used. Finally, the sample has been tested under standardized conditions that are defined on the Sample Description page (see page 2). AaI&A makes every effort to ensure but cannot guarantee that the samples are properly identified and documented and that test results are accurate. For this reason, AaI&A also strives to test independently produced sample replicates in order to increase sampling confidence and to provide information on process variability. Please compare the results in this report to replicate test samples when the data become available.

Understanding the Test Results

AaI_StandardB&Wset(v2).tif

The magnitude and visual appearance of fading depends not only on the chosen printing system but the chosen image as well. In other words, different images are comprised of different colors, and the fading relationships between those colors dictate how the image will look as it fades. The sample print in this test report was made by printing the digital image shown on the left. This image is designed specifically for monochrome printing applications. It contains 30 neutral colors ranging from maximum white ($L^*=100$, $a^*=0$, $b^*=0$) to maximum black ($L^*=0$, $a^*=0$, $b^*=0$). Any hue and chroma observed in the "Original Print Colors" were achieved by the printmaker's selection of media, RIP/driver settings, and choice of inks installed in the printer. The actual sample appearance reproduced in this report is digitally mastered from the colorimetric measurements of the test sample.

Information about the fading characteristics of the product is provided in three ways:"

- 1) You can visually assess the fading. The target images reproduced in this report are digitally reconstructed from the spectrally measured color data rather than scanning or otherwise reproducing the physical print by conventional techniques. This method ensures a colorimetrically accurate representation of the print appearance as the print fades. A calibrated monitor is recommended to experience the best possible reproduction of the test sample appearance. The side-by-side presentation of the target images simulates looking at the light-exposed print along side a perfect duplicate of the unexposed original print. The "Before/After" Layer mode takes advantage of Adobe Reader Layer technology. Toggle the "Before/After" layer on and off using the layers feature of Adobe Reader to directly switch between the light exposed print colors and the initial print colors for the image located on the right side of each page. Also, use Adobe Reader's full screen mode to cycle through the pages and "animate" the fading.
- 2) *I* Color and tonal accuracy scores are reported.* This report includes I* metric scores that compare the color and tonal relationships of the light exposed samples to the color and tonal relationships existing in the original print prior to light exposure. Perfect I* scores of 100% can be approached when no significant fading occurs. Average scores above 90% generally indicate excellent retention of original quality, 80% good, 70% fair, etc., but your conclusions may vary depending on your image quality requirements. *I* color* rates the retained color accuracy (hue and chroma) while *I* tone* rates the retained tonal accuracy (lightness and contrast). The score is on a percentile scale where 100% is a perfect match between the comparison image (e.g., "after" light exposure) and the reference image (e.g., "before" any light exposure). 0% *I* color* means no color accuracy is left. 0% *I* tone* means essentially no tonality remains and all image information content is lost. Negative I* values have significance as well and contribute to the average I* score when they occur. Negative I* color values mean false color has occurred, for example, when a skin tone turns green or a neutral gray becomes distinctly colorful. Negative I* tone scores mean visual contrast between colors has become inverted (i.e., like the tonal relationships in a photographic film negative). Serious image quality problems must arise before false colors and/or tones appear. For more information on the I* metric, please refer to the AaI&A web site.
- 3) Color changes are also reported using the classic color difference model, ΔE . Note that ΔE values lose perceptual scaling significance when they become large (e.g., > 15). Also, the ΔE equation does not unambiguously measure changes in image contrast. This limitation is generally not a problem for paints and textiles, but can be a serious oversight when evaluating photographic images. It was a major reason behind the development of the I* metric.

Page 1

Sample Description

Printer: HP Designjet Z3100 24"

Ink: HP OEM Vivera Pigment for Z3100 (grayscale mode)

Paper: Museo Silver Rag 300gsm (by Intellicoat)

Coating: none applied, but Gloss Enhancer used during printing

Sample #: AaI_20100717_SN005 Test Print Prepared by: AaI&A member

AaI StandardB&Wset(v2).tif

Test Image: AaI_StandardB&Wset(v2).tif

RIP/Driver settings: PSCS4, HP Designjet PCL3 raster driver v5.1 for mac,

Media Setting: custom (based on Fine Art Pearl more ink paper type, paper thickness = thick, dry time optimal, ink limits = 100%), more passes, gloss enhancer: whole page, photo black (PK).

Printed: July 17, 2010

Original print colors measured on: September 5, 2010

Test started on: September 12, 2010

Profile type: custom

| Maximum Printed black (UV included) $L^* = 7.8$ $a^* = 0.6$ $b^* = -2.2$ | | | | | | | | | |

Light Source: Phillips Colortone F40T12/C50 **Filter/Glazing:** Sample framed under Glass*

Light Exposure Cycle: 8 hours on, 4 hours off, twice per 24 hours

Average Illuminance during "on" cycle: 11,929 Lux

Average Temperature: 23.1 °C over full test duration, 24.5 °C during light exposure **Average Relative humidity:** 58.2%RH full test period, 58.0%RH during light exposure **CIELAB measurements:** D50 2° observer, Xrite Gretag/Macbeth Spectrolino/Spectroscan

Replicates/Compare to:

Notes/Comments:

- * The Phillips Colortone F40T12/C50 fluorescent light source and ordinary glass picture frame glazing yields UVA content and overall spectral power similar to natural 5000°K daylight entering a window and then striking a print that has been framed by **standard acrylic glazing** rather than ordinary glass. Other light sources and/or different glazing options may yield greater or lesser fade rates (generally, a 2-5x increase in fade rate for direct sunlight compared to UV–excluded sources at the same Lux level). The spectral quality of the light can also affect individual colors differently.
- ** Museo Silver Rag is claimed to be free of optical brightening agents (OBAs), and other batches tested at AaI&A are indeed OBA-free. However, this sample is right at the boundary for categorization in the "yes(low)" category for OBA rather than OBA-free. Totally OBA-free papers typically exhibit a UV \(\Delta \) ab influence reading (i.e., the \(\Delta \) a*b* difference between UV-included versus UV-excluded spectrophotometer readings) equal to 0.0 to 0.3. The UV \(\Delta \) ab influence is 0.5 for this sample. The sample does not appear to be misidentified. The surface texture and media whitepoint color is consistent with other Silver Rag sample batches in the AaI&A archives. UV blacklight examination also revealed that there is a low level of OBAs in the paper core of this sample but not in the coating. This result could be a batch-related issue where the paper mill that supplied the cotton fibre base may have recycled a portion of cotton furnish that contained some OBA. The amount is very low, exists only in the paper base not in the coating, and is therefore likely have little influence on the lightfastness performance of this sample.

Special Printing instructions: The test target file was converted to RGB via the custom profile, then desaturation applied to ensure color values R=G=B for all patches, then printed. When R=G=B (i.e. the colors are neutral), the HP Z3100 driver uses only the gray and black inks, no other color ink channels. The Z3100 thus has a unique photo gray ink (grayscale) mode when still printing as a full-color RGB file.

20 Mluxhr Interval – January 15, 2011: This sample was inadvertently not pulled from the light fade unit in time for its customary measurement at 20 megalux hours. The closest actual measurement to the 20 megalux hour interval was recorded at 22 megalus hours of exposure as noted in the test results shown on page 7.

| Table | to Convert Megalux-ho | ours of Lig | ht Ex | posur | e to es | timate | ed "Ye | ars on | Disp | lay" | | |

| 120 Lux 12 hours per day "Kodak Display Years" (1) | Average home illumination level for photos is ~ 60 lux. 90% of all displayed photos do not exceed 120 lux (1). | 1.90 | 19 | 38 | 57 | 76 | 95 | 114 | 133 | 152 | 171 | 190 |
| 228 Lux 12 hours per day | Relatively bright home or office. Note the simple 1:1 relationship between "years on display" and Mlux-hr values at this condition. | 1.00 | 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | 100 |
| 450 Lux 12 hours per day "WIR Display Years" (2) Also equals 500 lux for 11.8 hours per day | A bright home or commercial office building illumination level is 200-500 lux. Also, good illumination for color critical viewing and color matching tasks begins at about 500 lux. | 0.51 | 5 | 10 | 15 | 20 | 25 | 30 | 35 | 41 | 46 | 51 |
| 2000 Lux 12 hours per day | Commercial Gallery. Also, critical color evaluation standards call for 2000 lux and a D50 illumination source. | 0.114 | 1.1 | 2.3 | 3.4 | 4.6 | 5.7 | 6.8 | 8.0 | 9.1 | 10.3 | 11.4 |
| 5000 Lux 12 hours per day | E.g., Sunlight through a window striking print at an angle. | 0.046 | 0.5 | 0.9 | 1.4 | 1.8 | 2.3 | 2.7 | 3.2 | 3.7 | 4.1 | 4.6 |
| 10,000 Lux 12 hours per day | South-facing window in U.S.A., e.g., storefront display with photos directly facing window. | 0.023 | 0.2 | 0.5 | 0.7 | 0.9 | 1.1 | 1.4 | 1.6 | 1.8 | 2.1 | 2.3 |

Light levels commonly encountered in the real world fluctuate widely throughout indoor print display environments and produce large variations in how long it takes for artwork to acquire light-induced damage. Use this table as a guide to estimate how many "years on display" (denoted in red text) it takes to accumulate the light exposure test dosage. Review the test results to decide which Megalux-hour dose has caused fading to your level of concern (e.g., just noticeable, easily noticeable, objectionable, etc.). Then choose the print display description that best represents how your print is likely to be displayed. You may want to obtain a lux meter and make some measurements in your own display environment!

Note that as the years of display time increase, light-induced fading can be eclipsed by other serious aging mechanisms such as fading and/or staining caused by heat, humidity, and air pollutants. Mould damage can also occur at high humidity. Even when colorants remain water fast, direct contact with liquids may result in physical deformation and staining of the substrate. Also, temperature and especially humidity cycling can cause physical cracks and/or flaking, etc. Handling damage such as scratching, abrasion, tears and creases, and catastrophic damage by smoke, fire, flood, etc., also degrade print quality over time. Thus, as illumination levels are reduced other forms of degradation take on greater proportion of risk and may appear in shorter time intervals.

- (1) Eastman Kodak has cited this exposure condition and 90% confidence limit as a rationale for estimating print fading times of traditional color photo materials in typical home display environments. For recent light fading claims regarding its line of pigment-based inkjet printers, Kodak has adopted the higher level of 450lux/12 hours per day which is also used by Wilhelm Imaging Research, Inc. (See below).
- (2) Wilhelm Imaging Research (WIR) has standardized its light fastness ratings on 450 lux for 12 hours per day in order to estimate the years on display necessary to reach "noticeable" fading. This average light exposure condition, an assumed 75°F/60%RH temperature and humidity level, and WIR's visually weighted densitometric endpoint criteria set V3.0 has become a de facto industry standard for most predictive light fading estimates in the absence of a published International Standards Organization (ISO) test standard.
